

## *Moving a Window Around*

**Sometimes you want to move a window around on your screen because you want to get to your desktop or you want to put two windows side by side but you don't want to close the window. In either case click the "TITLE BAR" that thick blue bar across the top of your window and hold down the mouse button. Now move the mouse and the window will go with it. This is the same as dragging. When you have moved the window to where you want it release the mouse button. The window stays put until you move it back.**
